

Undermining Nuclear Non-Proliferation: Energy and Security Politics in the Australia-India-Japan-U.S. Nuclear Nexus 核不拡散の土台崩し オーストラリア・インド・日本・米国間におけるエネルギーと安全保障政策

Adam Broinowski

The inception of the U.S.-led nuclear alliance system

From the world's first atomic test on 16 July 1945, uranium, nuclear reactors and nuclear weapons have played a key role in the US-led alliance system. As the former axis powers of Japan, West Germany and Italy as well as other strategically important territories such as South Korea, the Philippines and Taiwan, were incorporated in a US foreign policy designed to confront and contain the Soviet Union and the People's Republic of China, nuclear weapons were deployed with the justification of being necessary to deter large Communist conventional forces. In the New Look doctrine of 'massive retaliation' introduced under Eisenhower, Truman's policy of targeting roughly seventy Soviet cities with 133 atomic bombs over thirty days (Operation Fleetwood) was magnified to the use of nuclear weapons like normal munitions and therefore increasing their stockpiles and yield capacity. While the PRC was repeatedly threatened with nuclear strikes from air and missile delivery platforms during the Korean War, as was North Korea, and during the crisis in the Taiwan Strait in the 1950s, by late 1960, a single integrated operational plan (SIOP-62) targeted Soviet, Chinese and satellite cities with the simultaneous launch of all nuclear forces without restraint.¹

Initiated by Joint Chiefs of Staff Chairman General Nathan Twining and Chief of Naval Operations Admiral Arleigh Burke, and then

presided over by General Thomas Power, Director of the Joint Strategic Target Planning Staff (1960-1964), SIOP-62 mapped out a synchronized nuclear attack by the U.S. Air Force, Navy and Army combining strategic bombers, Polaris submarine-launched missiles and Atlas ICBMs in an 'alert' force of over 1,706 nuclear weapons and a 'full' force of over 3,240 nuclear weapons delivered to 1,060 targets in the Soviet Union, China and allied states. In this Plan there was little or no distinction made between Communist states that were at war with the United States and those that were not. Some sites (Designated Ground Zeroes - DGZs) would be struck by two or more weapons, and included both military installations and urban-industrial areas. The alert force would target 199 cities and the full force would target 295.² The planners estimated that the total human deaths from such an attack would be 108 million in the Soviet Union and 104 million in the PRC as well as several million in satellite states,³ while Kaplan estimated that 175 million Russians and Chinese would be killed by the 'alert' force and 285 million would be killed by a 'full' force, and an additional 40 million more injured.⁴ To make such threats credible, the Departments of Defense (DoD) and Energy (DoE) and the U.S. Atomic Energy Commission (AEC) conducted visible tests of new nuclear weapons in various atmospheric conditions in a twenty test series between 1946 and 1963. Even after the limited test ban treaty was adopted, they continued with underground tests.

General Thomas Power presided over the creation of SIOP-62 as Commander in Chief, Strategic Air Command (1957-1964) and Director, Joint Strategic Target Planning Staff (1960-1964).

As nuclear intimidation continued, and as other nations sought to gain ‘parity’, the global nuclear industry grew. It was clearly understood in these early decades that the dual-use of nuclear materials in nuclear energy generation and nuclear weapons served to establish and maintain national influence in the international arena. Since 1945, the supply and procurement of uranium together with coal (for steel production) has been a good indicator of a nation’s capacity to both rapidly increase its energy production with the potential to produce munitions and, for those states already with the capacity, to produce and enhance a nuclear weapons arsenal. High-energy power generation was an index of a nation’s war-making potential underlining the link between mining and militarisation.

In the following I seek to explain why and how the Australian government in 2014 has concluded a uranium trade deal with India that is in breach of the Nuclear Non-Proliferation Treaty (NPT) by tracing the development of a

nuclear nexus between India, Australia, Japan and the United States. Just as it was in the early cold war, this trade in nuclear materials is informed by interlocking and mutually reinforcing economic and geostrategic interests that have long undermined international disarmament initiatives. I argue that changing climatic conditions caused by emissions intensive energy production, however, demand a fundamental re-thinking of this paradigm.

Crisis and Response in the post-2011 nuclear industry

The disastrous nuclear meltdowns at the Fukushima Daiichi nuclear power plant following 11 March 2011 re-awakened the world to the dangers of nuclear power after the nuclear disasters of Three Mile Island in the United States (1979) and Chernobyl in Ukraine (1986). The price of uranium in the global markets plunged from a peak of US \$135/pound in 2007 to US \$30/pound by 2013 in part due to the Fukushima Daiichi nuclear disaster whose effects included sharp cutbacks or even termination of plans in some countries to build nuclear reactors, and in part due to uranium stockpiles and oversupply.⁵ Many advanced economies, led by Germany, downscaled, shut down and turned away from nuclear energy projects and toward renewable energy production. Rising costs (including insurance), construction delays, complex managerial coordination and onerous safety requirements, public opposition and ageing fleets of reactors have made it difficult to justify committing to new nuclear power projects for the supply of energy targets. As global electricity supply from nuclear power generation declined from a high of 17.6 percent of global power generation in 1996 to 10.8 percent in 2013 - the lowest level since 1980, the number of operating units reduced to 388 (fifty less than the peak in 2002), nuclear power capacity declined by 19 Gw between 2000 and 2013,⁶ and global nuclear power generation dropped by 4 percent in 2011 and a

further 7 percent in 2012. By one estimate, roughly three-quarters of this decline was due to the Fukushima Daiichi meltdowns, while the remaining quarter was due to a decrease of nuclear generation by 16 other countries.⁷

Of the 67 reactors under construction globally as of July 2014, at least 49 were experiencing delays and eight had been under construction for 20 or more years. China too, having planned before 2011 to replace heavy carbon emitting coal-fired power stations with nuclear power stations, stalled and re-assessed its position after 3.11.⁸ For the most part, China (along with the US, India and Germany) has boosted its renewable electricity generating capacity so that by 2013, it produced through wind, solar and hydro power over 1000 terawatt hours – the equivalent of the total power generation of France and Germany.⁹ In Japan, nearly four years after the Fukushima Daiichi meltdowns, 46 other nuclear reactors remain shut down. The Nuclear Regulatory Authority (NRA) approved the restart of two reactors in Sendai, Kyushu on 10 September 2014 and Mayoral consent was secured in October.

Until 2014, along with China, Japan has also seen a boom in mostly solar and wind electricity generation. But this has been stalled by utilities who have refused to take an influx of renewable power into the grid or to reduce electricity prices.¹⁰ With fewer nuclear plants scheduled for construction around the world than for shutdown, however, the nuclear industry faces the likely prospect of contraction¹¹ and replacement by rapidly advancing renewable energy options, including solar, wind, tidal, hydro and possibly geothermal power over the longer term.

Despite this gloomy prognosis for the uranium sector, confidence began to return to the uranium mining industry in Australia from late 2012. One significant reason for this was the election of the Liberal Democratic Party (LDP) in Japan in December 2012. Shares of uranium

producers Paladin and Rio Tinto/Energy Resources Australia rose by 8 percent and 5 percent respectively in the days after the election and the spot price of uranium compound rose from \$US 40.80/pound in November to \$US 44/pound in December 2012.¹²

New mining leases were approved in Western Australia, Queensland and New South Wales, and Queensland Premier Campbell Newman broke his electoral commitment not to permit uranium mining by inviting uranium mining companies to commence exploration operations. The new (Queensland) Mineral and Energy Resources (Common Provisions) Bill 2014, for example, passed on 9 September 2014 authorizes a Coordinator General to overrule community objection rights to ‘State significant projects’ including coal, bauxite and uranium mines, or to limit them to concerns unrelated to environmental protection.¹³ This Act gives virtual immunity to large companies exploring for uranium deposits in the Mitchell and Alice River basins in Cape York and the Gulf country. Encouraged by these positive signs, along with other Japanese, Chinese and Indian investors in uranium projects in Australia, the major French energy corporation Areva recently bought a 51 percent share in a joint venture with Australian uranium miner Toro Energy for exploration in the Wiso Basin in Northern Territory.¹⁴ In other words, federal and state governments in Australia have been approving exploration licenses and the opening of uranium mines at a time when the global nuclear and uranium industry was marked by decline and exit.

While some of the larger corporations chose to wait for uranium demand to rise, many in the Australian uranium mining industry scrambled to reprioritise, turning to the newly emerging market of nation-states tipped for rapid economic expansion. India attracted attention due to its high-growth economic potential, geostrategic positioning and nuclear ambitions.

As then Prime Minister Howard had done in 2007, ‘energy starved’ India’s ‘power crisis’ is again being widely portrayed in desperate terms,¹⁵ while the solutions are presented as economic expansion and greater energy consumption by a growing middle class.¹⁶ In addition to coal exports, Australian politicians, in consultation with business representatives in the uranium and minerals sector, have framed the push for uranium trade with India as a ‘moral duty’ and ‘humanitarian responsibility’ to improve living standards of India’s impoverished people.

Since the early 2000s Australian uranium interests have sought to retain and expand market share by arguing that increasing nuclear power reliance could support the demands of the rapid growth economies of China and India while achieving lower carbon emissions than coal-fired power and cheaper and more reliable energy than renewable alternatives. In the period known as the ‘nuclear renaissance’, in 2004, the US and Britain also moved to re-commence new nuclear power plant construction after inaction since Three Mile Island and Chernobyl. Even after 3.11, these plans (such as in Georgia, Tennessee, and South Carolina in the US and Hinkley Point in the UK) appear to be continuing.¹⁷

On 7-11 July 2014, Japanese Prime Minister Abe made a five-day visit to Australia, which included a trip with Prime Minister Abbott to the Rio Tinto operations in the Pilbara region in north-western Australia. They visited the open-pit iron ore mine in the West Angelas mine, south-east of Cape Lambert, in which Rio Tinto has a share of 53 percent, Mitsui Bussan 33 percent and Nippon Steel & Sumitomo Metal Corporation 14 percent. Other Japanese companies including Japan Uranium Management Inc (JUMI) and Japan Australia Uranium Resources Development Co Ltd (JAURD), Mitsubishi, and Itochu also have shares in uranium mines (Kintyre, Lake

Maitland) in this region. The day Abe arrived, the CEO of the Mitsubishi Corporation (heavily involved in nuclear technologies) announced that Australia was a ‘veritable lifeline’ for Japan’s resource-dependent economy, and promised billions in investment in Australia’s resources sector, agribusiness and retail.¹⁸

Over the nearly four years since the Fukushima disaster, the Japanese government and corporations have actively courted more than 20 countries for the purchase of Japan’s nuclear technologies. Agreements had been reached with Jordan, Vietnam, South Korea and Russia under the Kan and Noda Democratic Party Japan (DPJ) governments, and the export of nuclear technology remained central to the Abe government’s economic plans. Two more nuclear technology agreements with Turkey and the United Arab Emirates have since been reached,¹⁹ and six more are under consideration - with India, South Africa, Mexico, Brazil, Saudi Arabia and Bangladesh. Despite the continuing negative effects of ongoing radioactive contamination dispersal from the Fukushima Daiichi nuclear plant, the Abe government remains intent both on nuclear startups in Japan and on promoting its exports of nuclear technology to other countries.

These activities on the nuclear industrial front occurred in the context of Japan’s steadily deteriorating relations with China, the establishment of a National Security Council (December 2013), the commitment to a substantial increase over time in military spending,²⁰ and the Cabinet reinterpretation of the constitution (in July 2014) to permit collective security operations with the US and its allies. In 2014, Abe also made vigorous diplomatic initiatives to secure security and trade agreements with the US, UK, EU, Australia, India and the ASEAN nations. He devoted special attention to the Philippines, Vietnam and Myanmar. A free trade agreement was negotiated with Australia that moved toward the purchase of Japanese Sōryū-class

submarines, designed to counter China's anti-access/area-denial (A2/AD) capacities and to support US Navy carrier strike groups.²¹

A similar initiative followed on 5 September 2014, when Abbott and Indian Prime Minister Narendra Modi signed the Australia-India Nuclear Cooperation Agreement in New Delhi. It was the culmination of the efforts initiated by the Howard government in 2006,²² carried forward by the Gillard government in 2011-2012.

After India's 'Smiling Buddha' Pokhran-I nuclear tests in May 1974, when the Indian government declared that it intended to harness nuclear energy to manufacture nuclear weapons, the Australian government (and many other countries including the US) placed a ban on exporting uranium to it (France and Russia continued to sporadically export uranium under a safety clause). India had built its clandestine nuclear weapons program using imported Canadian reactors.

Since Nehru, India has justified its indigenous development of civil and military nuclear capacity and fuel and its refusal to ratify the Nuclear Non-Proliferation Treaty (NPT) by pointing to the nuclear weapons held by existing nuclear weapons states. It has argued that the NPT is a flawed agreement that reflects the hypocrisy of the nuclear weapons states in refusing to seriously engage in disarmament while expecting non-nuclear weapons states to abstain from possession. In 1975, partially in response to the Indian tests of the previous year, the Nuclear Suppliers Group (NSG) initially comprising seven nations (United States, United Kingdom, Soviet Union, Japan, France, Canada, West Germany) was formed to prevent the diversion of nuclear materials used for commercial and peaceful purposes for the production of nuclear weapons. NSG members were obliged to cease trade with governments that did not submit to

international inspection. India and Pakistan were included. Despite the bans, India went ahead to conduct its Pokhran II nuclear tests in May 1998. These were followed by Pakistan's tests two weeks later. UN Security Council Resolution 1172 of June 1998²³ expressed grave concern and demanded that both countries foreswear further tests and abandon their nuclear weapon ambitions.

Despite the resolution's unanimous adoption and threat of sanctions, the turning point was when the George W. Bush administration (2001-2009) chose to prioritize U.S. bilateral relations with India over any unified front to counter nuclear proliferation. The US-India energy agreement of July 2005 opened the way for other states, such as Australia, to engage bilaterally with India.

In 1996, Australian PM John Howard (1996-2007) had already scrapped the Australian Labor Party-initiated Three Mine (uranium) policy (in place since 1983, it compromised the original outright ban on uranium mining), which limited uranium mining in Australia to Olympic Dam (SA), Ranger (NT) and Beverley (SA). After the US-India agreement, the Howard government actively sought to reverse the bi-partisan long-term ban on exporting uranium to non-NPT signatory states in keeping with the NPT and announced the decision to allow exports to India in August 2007. In November 2007, the Rudd-led Labor party (2007-2010) claimed electoral victory, and decided to continue to carry into government the decision to expand uranium mines while permitting state and territory governments to veto that policy. But the Rudd government reversed Howard's initiative with India and reverted to the ban on exports to non-NPT states.²⁴ Nevertheless, China had already taken the opportunity by signing an agreement with Australia in April 2005 to permit it to conduct exploration for uranium in Australia and to import 20,000 metric tonnes per year of it for power

generation from 2010,²⁵ and in 2008 India's Reliance Industries also invested in Uranium Exploration Australia Ltd (UXA) in order to secure uranium exploration licences.²⁶

Meanwhile in October 2008, the Singh government overcame stiff opposition in parliament to secure national and international backing for the signing of the US-India '1-2-3' Nuclear Cooperation Agreement. This Agreement stipulated that India would open its civilian nuclear facilities to inspection by the International Atomic Energy Agency (IAEA) and delineate its civil and military facilities so as to ensure US-origin fuel would not be used for military purposes. In return the US would supply nuclear fuel and nuclear technologies (six reactors) and gain greater access to the Indian nuclear market.

As unanimous approval from the 48 states of the NSG was also required, the US and India lobbied hard and secured an unprecedented waiver of NSG export guidelines so as to permit nuclear commerce with India despite its non-NPT signatory status. Having granted the exception, several NSG members then negotiated bilateral nuclear accords with India (including France, United Kingdom, South Korea, Canada and Kazakhstan). In 2008 the Singh government purchased 300 MT of uranium ore concentrate from Areva of France, in 2009 2000 MT of uranium oxide pellets and 58 MT of enriched uranium dioxide from JSC Tvel/Russia, also in 2009 2100 MT of uranium dioxide concentrate from NAC/Kazakhstan and in 2013 2000 MT of uranium ore concentrate from NMMC Uzbekistan.²⁷ While details are yet to be finalised, the deal with Australia in 2014 would secure for India a steady, reliable, high-grade uranium supply from the world's largest known uranium deposits (its uranium resources are about 28 percent of the world total).

But it was not all smooth sailing. In the 2008 Indo-US nuclear cooperation agreement²⁸ India

promised to improve its regulatory framework for nuclear safety. It was also obligated to sign and ratify the International Atomic Energy Agency's Convention of Supplementary Compensation (CSC),²⁹ a pre-formulated text that exempts suppliers from any liability and fixes 'absolute' and 'exclusive' liability on the operator of a nuclear installation. Prior to ratifying the CSC, however, the Indian government passed the Civil Liability for Nuclear Damage Act (CLNDA) in 2010, whose Article 17(b) stated that the operator has a right of recourse where the nuclear incident resulted as a consequence of an act or negligence of the supplier.³⁰

In November 2010, in a joint statement signed by US President Obama and Indian PM Singh, it was agreed that negotiations would begin between Nuclear Power Corporation India Ltd (NPCIL) and US nuclear energy companies in return for implementing India's full membership of the NSG in a 'phased manner'. India agreed to accommodate the demands of General Electric and Westinghouse, which sought strict adherence to the CSC³¹ by diluting the CLNDA to reduce both suppliers' liability and the time period for exercising right of recourse in the Civil Liability for Nuclear Damage Rules 2011.³² The US-India Business Council, PM Modi and industry executives from the Nuclear Power Company of India Ltd. (NPCIL) also devised an insurance package to indemnify the American suppliers in the event of a nuclear accident for the maximum liability amount stipulated in the CLNDA (INR 1500 Crore/\$250 million).³³ This was to encourage US/Japan companies (among others) to collaborate in building new nuclear reactors to allow India to 'achieve its full blown potential'.³⁴ In short, India would take as close to full liability for nuclear accidents as possible in return for receiving the benefits of NPT and NSG membership without the full obligations expected of its members. In doing so, the integrity of the NPT was further compromised.

Australia joined this practice in 2011 after Rudd was ousted as Australian party and national leader in 2010, and his successor PM Gillard resumed the Howard policy toward India. In December 2011, she declared that it was in ‘the national interest [to strengthen] our strategic partnership with India in the Asian century’. In 2012, the New South Wales Labour government lifted the ban on uranium mining, and both Canada and Australia negotiated a uranium trade agreement with India.³⁵

Given that Australia’s uranium mining and export accounts for less than 1 percent of its hundred billion dollar mineral export business (iron ore, bauxite, coal, copper, nickel etc),³⁶ however, these decisions by Australian leaders risked significant political capital over what has been a highly contentious issue in Australia’s recent political history.

Nuclear trade with India: Breaching the NPT

The Nuclear Non-Proliferation Treaty is one of several Arms Control and Disarmament treaties to which most of the 190 member states have signed. With its three central tenets of Non-Proliferation, Disarmament and Peaceful Uses of Nuclear Energy, the NPT supports the grand bargain in which

the NPT non-nuclear-weapon states agree never to acquire nuclear weapons in exchange for which the NPT nuclear-weapon states agree to share the benefits of peaceful nuclear technology and to pursue nuclear disarmament aimed at the ultimate elimination of their nuclear arsenals.

Nuclear weapons states have had the primary responsibility to ensure disarmament of their own arsenals so as to prevent nuclear non-proliferation among other states. The export

controls regime of the NSG and enhanced verification measures of IAEA (International Atomic Energy Association) Additional Protocols are ostensibly to end every possible means to acquire nuclear weapons. While Article Four of the NPT provides ‘inalienable rights to every non-nuclear weapon state’ to pursue nuclear energy for power generation, India is neither a member of the NPT nor a Non-Nuclear Weapon State and there is no provision in the NPT which permits for signatories to form nuclear cooperation agreements with Non-NPT states.

India quite rightly has pointed out the hypocritical approach of the nuclear weapons states in approaching the NPT regime. As the Indian External Affairs Minister Pranab Mukherjee stated in 2007, India was not an NPT signatory because it considers the regime to be not one of ‘universal, non-discriminatory verification and treatment’.³⁷ In the same statement, Minister Mukherjee also claimed that India had an ‘impeccable record on non-proliferation... [was] a leading advocate of the elimination of all nuclear weapons... [and was an adherent] to the values of peace and non-violence’. India’s ‘impeccable track-record on non-proliferation’ was a catch phrase coined by President Bush in 2005,³⁸ and reiterated by both PM Modi and PM Abbott in 2014.

Treating India as an exceptional case and a *de facto* nuclear weapons state makes even more conspicuous the selective imposition of sanctions or favour upon other non-NPT signatory nuclear weapons states such as Pakistan and Israel, or NPT signatory non-nuclear weapons states such as Iran.³⁹ But the self-interested and strategically motivated application of the NPT was not new, nor was it limited to the US and its allies. The Soviet Union supplied China with the necessary technologies and skills to develop its own nuclear weapons capabilities, as China then supplied Pakistan. In turn, Pakistan also supplied other states that aspire to obtain

nuclear capabilities. All were in a chain reaction, however, to U.S. threats to China and ultimately to the Soviet Union, in the early decades of the Cold War. While it is debatable that uranium and nuclear technology supply to India by others might serve to deter contemporary Chinese or Pakistani nuclear aggression, it has not served to prevent Indian conflicts with either of those two nations in the past. In any case, the use of nuclear trade as a strategic instrument does not ensure greater security or stability of the international community broadly defined, and this sort of leverage is not a valid use of the NPT.

So despite PM Abbott's assurances that 'suitable safeguards' were in place to guarantee that Australian uranium would be used for 'peaceful purposes' and for 'civilian use only', as the former Director General of the Australian Safeguards and Non-Proliferation Office John Carlson points out, the Agreement departs from two principles of Australia's 1987 Safeguards Act (section 51):⁴⁰ the acquirement of 'consent to reprocessing' from the Australian government prior to the separation of plutonium from spent fuel; and the 'right of return' of nuclear materials supplied in the event of a breach of the agreement.⁴¹ Instead, the Agreement defers to the US-India nuclear cooperation agreement in which India would reprocess in facilities built with the assistance of US companies, and leaves open the question of how separated plutonium would be used or how arbitration would apply to settle disputes.

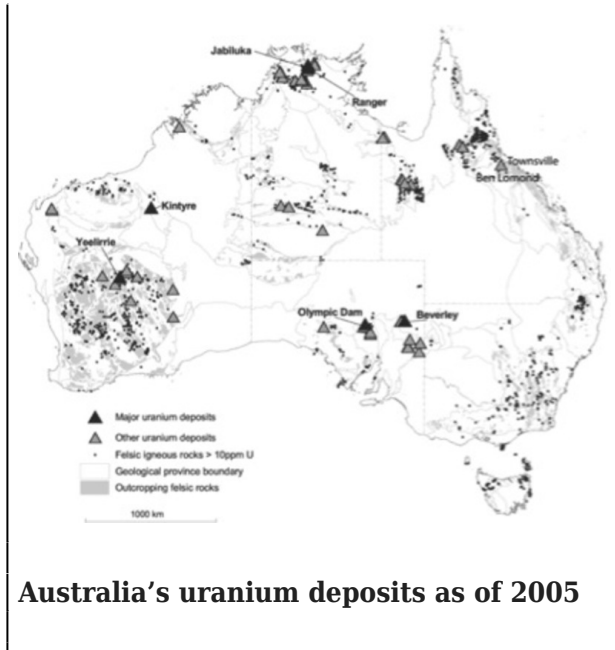

Ten of India's twenty nuclear facilities are beyond the regulatory authority of the IAEA and India only selectively recognises IAEA safeguards for specific foreign supplied reactors and facilities. India also refuses to submit to suppliers inventory reports and accounting processes for nuclear material flowing through the nuclear cycle. As the IAEA is not able to fully inspect India's dual-purpose (civilian and military) indigenous reactors and facilities for reprocessing, enrichment,

retransfers to third countries, research and development or the production of tritium (used as a trigger for weapons), India is not fully accountable to either the IAEA or the supplier nation with which it has a bilateral agreement with in-built IAEA norms.

So even if India adheres to Australia's requirements that its uranium be used solely to supply civil nuclear reactors for electricity generation that may be inspected by IAEA as per the nuclear safeguards agreement, Australia's (or any other NPT members') uranium export to India effectively supplements or liberates limited supplies of Indian uranium for military uses.⁴² Nor could, in the unlikely discovery of the 'misallocation' of some Australian origin uranium toward military use, the IAEA force compliance. In fact, whether or not India accounts for the flows of Australian material in its nuclear fuel cycle, it is impossible to verify whether it has actually adhered to the safeguards.

In sum, the contingent or 'strategic' approach to nuclear non-proliferation as led by the United States and the former Soviet Union has undermined the credibility of the IAEA safeguards as part of the NPT regulatory regime.⁴³

The costs of boosting India's rise

All of Australia's three currently operational mines – Ranger, Olympic Dam and Beverley – are known to have caused environmental problems by seepage and dispersal from their tailings dams into the surrounding ecosystem. From 80 possible uranium sites in Queensland, the new demand from India for Australian uranium will likely draw from the Mary Kathleen mine which has re-opened despite its negative environmental impact on surrounding lands, and the Ben Lomond mine near Mt Isa in Queensland. Uranium will likely be shipped from Townsville Port, which has applied to become the state's yellowcake gateway. Together with coal mined from the gargantuan Carmichael Coal and Rail project in the Galilee Basin, which has been approved by the Queensland government (owned by Indian coal giant Adani, Australia-India combine GVK Hancock, and Palmer's Waratah project), the uranium will be shipped from a new export terminal at Abbot Point. Unless plans are halted, ships will depart from these ports and pass through a newly dredged channel through the world heritage-listed Great Barrier Reef. Alternatively, the material could be freighted by road to Darwin or Adelaide ports (which hold uranium licenses).⁴⁴ Environmentalists in both India (Conservation Action Trust) and

Australia (Greenpeace/Environmental Justice Australia) mounted a campaign against the Carmichael mine arguing that it threatens the health and livelihood of poor rural people in India while not delivering the benefits promised, and is contrary to the principles of ecologically sustainable development.⁴⁵

As has been recommended by the United Nations (UN), World Health Organisation (WHO), International Energy Agency (IEA), Intergovernmental Panel for Climate Change (IPCC), and recognised by the World Bank and the European Investment Bank, the rapid phase out of coal-fired power stations is essential if the world is to meet the now seemingly optimistic carbon emissions reductions necessary to keep planetary warming below 2 percent of pre-industrialisation levels.⁴⁶ While two hundred licenses for coal-fired power stations have been revoked by the Supreme Court of India recently, many Indian overseas coal projects are still underway.

Alongside boosting its renewable energy production (such as the Gujarat Solar Park), the Modi government has claimed that nuclear fuel and more nuclear reactors are essential if India is to meet its ambitious targets to double

national energy consumption (presently 949 kwh) and triple electricity generation (presently 135 kwh) over the next 20 years. It favours locally-designed Pressurised Heavy Water Reactors (PHWRs) at 700 Mw per unit, and imported Light Water Reactors (LWRs) of roughly 1000 Mw per unit, procured and built in accord with bilateral agreements with nations like the USA, Japan, France, and Russia. The electricity generated from 19 nuclear reactors it plans to build with a total of 17,400 Mw capacity over the next five years would increase from 4 to 25 percent, or about 20,000 Mw by 2020 and 62,000 Mw by 2032. This would bring it to half of China's current power consumption level, which is roughly 4000 kwh.⁴⁷

Such plans help explain PM Singh's welcome for PM Abe in India in January 2014, and explain why just prior to Abbott's visit to India in September 2014, PM Modi visited Kyoto and Tokyo for five days from 31 August 2014. Although Modi failed to clinch the much-anticipated Japan-India Nuclear Cooperation Agreement, he reportedly secured Abe's pledge to speed up discussions on a nuclear agreement.⁴⁸ With the promise of Japanese investment (\$35 billion over five years), the Japan-India relationship was upgraded to a 'special strategic and global partnership'. Modi has set up a 'Japan-plus special management team' under the Prime Minister's Office to fast-track approvals of investment proposals from Japan. Even if India did not procure Japan's turbines for 1000 Mw capacity reactors, it could seek supply from France, Russia or South Korea.⁴⁹ With guarantees from Australia and Japan, Modi then met with President Obama on his maiden visit to the United States where they agreed, alongside security, space and technology, aid, infrastructure and investment issues, to focus on the shift to renewable energy while boosting electricity production.⁵⁰ No specific definition of 'renewables' was included but cooperation on civil nuclear energy from U.S.-built nuclear power plants in

India was high on the agenda.⁵¹

Actual risks

There are a number of flaws underpinning the logic of this activity between political leaders and nuclear industry executives. PM Abbott insisted at the time of signing the nuclear deal with India that the Agreement would be safe. In fact, the Abbott government has committed to selling uranium to an ambitious nation that barely conceals its intentions to expand its nuclear weapons arsenal and has refused to become a full signatory to the NPT and, along with the US, China and Pakistan, has not ratified the Comprehensive Test Ban Treaty (CTBT).

Prime Minister Modi is a pro-business politician and hardliner on Pakistan and Muslim populations in India and favours a security policy based on nuclear deterrence. The BJP holds a commanding majority in the lower house of Parliament. There is little reason to assume that Indian relations with Pakistan - or indeed with China - will soften by furnishing India with greater means to project its military power in the region. The surge of fundamentalist and jingoist forces in South Asia and rising military budgets and tensions between India and Pakistan on the one hand and China and the US, Japan and its allies on the other, aggravate the security situation in the region. Further, India has been waging an on-going long-term campaign against an insurgency within its borders, and it cannot guarantee against theft of nuclear-related materials.

Second, the Indian government continues to maintain a very repressive approach to imposing nuclear installations and uranium operations on vulnerable communities (such as in Gorakhpur, Koodankulam, Jaitapur, Mithi Viridi, Chutka, Kovvada, Jaduguda). This has produced significant civil protest, and led to the deaths of five protesters since 2010. Those in Australia who promote uranium trade with

India for nuclear power projects as the solution to Indian poverty rarely acknowledge the danger this poses to 'the safety and livelihoods of the most vulnerable and politically disenfranchised sections of Indian society - farmers, fisherfolk, tribal women and children', as Indian physicist M V Ramana observes. Likewise in Australia, uranium mining activities predominantly affect Aboriginal communities.⁵²

Scientific studies of communities living around mines and nuclear reactors have found that dust and water nearby are contaminated with heavy metals from India's central forty five year old uranium mine operated by Uranium Corporation of India Ltd. (UCIL) in Jaduguda in Jharkhand (19,500 people). Toxic materials in water, fish, animals, crops and humans have steadily accumulated. This has produced higher rates of sterility, shorter life expectancy, disease and congenital malformations in communities who live near the Jaduguda uranium mining operations.⁵³

Third, given that Japan's nuclear industry and government have proven unable to properly contain the damage from a disaster at one of its domestic nuclear power stations, India's nuclear industry, which is under much less regulation faces even greater risk. The increasing number and frequency of extreme weather events adds to the risk of similar disaster(s) involving these mega-technologies in India. This point has recently been emphasised in Japan again, in the recent volcanic eruptions of Mount Ontake and Mount Sakurajima both of which are within 50 kms of the Sendai nuclear power plant in Kyushu that is soon to be restarted. Despite the high risk of nuclear power stations sitting atop a geological 'Ring of Fire' on the Japanese archipelago, the Japanese government continues to assure the public that there is no danger and that safety measures and evacuation plans are sufficient.⁵⁴

Fourth, the option of nuclear power as the 'clean' alternative is nothing of the sort.

Although the fission operation of nuclear power stations may be 'cleaner' than coal-fired power stations in terms of carbon emissions, and although the heat from fission may produce more energy and less waste per volume of uranium than coal, many problems remain unresolved. These include the safe storage of long-lived nuclear waste, long build time of reactors in proportion to rapidly accelerating effects of climate change, enormous financial costs, use and contamination of vital resources required across the nuclear cycle from mining to waste production (including water and fossil fuels),⁵⁵ centralised monopolisation of power management necessitated by nuclear power generation, excess heating of the atmosphere through the discharge of excess heat through water and air, danger to ecologies downwind or downstream from venting while refueling reactors, and increased potential for large-scale and long-term damage from accidents.

Given the advances of wind, solar, tidal and geothermal energy production which have become cheaper and more productive, as field-tested in China, Germany,⁵⁶ Spain and other countries, and the abundance of these sources of energy in countries like Australia, the myth of base-load power is less sustainable than it was in the heady renaissance days. India's pitch to rapidly increase economic growth has been embraced by the transnational nuclear industry as it represents an opportunity to expand the nuclear industry, and an opportunity to diversify from reliance on the Chinese market. But when typical cost-benefit analyses are extended to include the actual costs of the above-mentioned scenarios (nuclear weapons exchange, public health effects from industrial pollution from uranium mining and nuclear reactors, nuclear reactor disasters, nuclear waste storage, renewable energy alternatives), in an already fragile ecology in India, India's nuclear energy plan reflects neither deep commitment to climate change mitigation nor serious concern for India's impoverished populations.

To resume and expand uranium mining and nuclear energy generation will not significantly reduce the effects of climate change. The possibility of nuclear accidents presents a serious, long-term security, social and environmental threat. The standards required to prevent such threats are too onerous, and the damages from the manifestation of such threats are too enormous to be sufficiently covered by insurance. The risks of uranium trade and nuclear projects far outweigh the benefits. This is understood even in the 'pragmatic' world of business economics.⁵⁷

Why does the Australian, Indian, the United States and Japanese governments (among others) and their affiliated transnational corporations, continue to accelerate nuclear related operations despite these significant obstacles?

Geostrategic considerations

Although Modi returned from his August meeting with Abe without a nuclear agreement, he is proceeding to consolidate India's power and industrial base and feed into an upgraded and stronger military-strategic 'partnership' with Tokyo. Japan seeks to encourage India to develop a blue-water navy (a naval capacity to project power over large distances), ostensibly so as to 'fill the power vacuum' left by a declining U.S. military presence in the Indian Ocean or due to its preoccupation elsewhere.⁵⁸ Japanese armaments, and missile technologies in particular (whether from Japan or elsewhere), will advance the integration of Indian with US, Japanese and Australian military operations. Although India maintains significant financial involvement with China in the Asia Infrastructure and Investment Bank (AIIB) and BRICS bank and is considering the recent Chinese invitation to join the Shanghai Cooperation Organization, India's 'Look East' security policy focuses on cultivating relations with ASEAN nations and favours a trilateral military security cooperation between the US,

India and Japan (with Australia as a possible fourth). Japan has participated in the annual US-Indian Malabar naval exercise since 2010 and the annual Japan-India Military Exercises (JIMEX) ongoing since 2012 as a gesture toward securing its supply lines in the Indian Ocean. These rehearsals slot neatly into an overarching US anti-China 'pivot' and serve as a 'counter-balance' to the perceived rise in Chinese power in the Asia-Pacific.⁵⁹

It is unlikely that the Japan-India Nuclear Cooperation Agreement went unsigned because of any putative scruple Japan may have about selling nuclear technologies to India as a non-NPT nuclear weapons state. As the Modi and NPCIL accommodation of American supplier demands demonstrates, the liability clause can be flexible. It remains unlikely, however, that India will consent to opening all of its reactors for inspection.⁶⁰ Rather, it is likely that Japan is awaiting an American executive decision on the liability issue and the possible inclusion of India into the NPT as a nuclear weapons state, since prior agreement would appear to abrogate Japan's NPT obligations.

That PM Modi reasserted India's customary 'no first use' policy does not mean that he does not intend to stockpile and bolster India's nuclear arsenal. The Stockholm International Peace Research Institute (SIPRI) estimates that India possesses 90 to 110 nuclear weapons.⁶¹ In June 2014, the IHS (Information Handling Service) Jane's military research group identified what they believe to be a new uranium hexafluoride (enrichment) facility at the Indian Rare Metals Plant near Mysore. As with its other military plants, this plant is not within IAEA safeguards. Estimated to be operational by mid-2015, it would produce roughly double the amount of enriched fuel (160 kilos a year enriched to 90 percent purity) required for India's ballistic missile nuclear submarine fleet.⁶² The IHS analysts surmise that the surplus could be used for thermonuclear weapons (mixing enriched uranium and plutonium stockpiles).⁶³ It could

also be used to fuel nuclear submarines, space satellites, tactical and intermediate ballistic missiles, and multiple warhead Intercontinental Ballistic Missiles (Agni V ICBM MIRVs) with the ability to reach cities in China and Pakistan. India joins the US, Russia, UK, France and China in possessing the ICBM with MIRV, leaving Pakistan further behind in terms of weapons parity, particularly in navy, air and ground forces, and missile capabilities.⁶⁴ As India seeks to rival China, it could further destabilize relations with Pakistan by intensifying the ongoing arms race between the two. Regional tensions could be further exacerbated by Pakistan's border skirmishes with Afghanistan and Iran over its support of the Taliban in Afghanistan.⁶⁵ Along with increasing tensions involving US-Japan-India and China, this is precisely the scenario that NPT members have tried to avoid by subscribing to IAEA safeguards.

'Nirbhay' sub-sonic cruise missile launched from Chandipur, Odisha, India on 17 October 2014

The US-led initiative for the NSG (including Australia) to engage in nuclear commerce with India has the additional effect of opening the opportunity to loosen NPT and IAEA safeguards for other states, and possibly NPT members. As a uranium supplier, Australia's consent to allow reprocessing until now has been limited to the

EU (UK and France) and Japan, stated to be for the purposes of reprocessing spent fuel into plutonium and MOX fuel for use in nuclear reactors for electricity generation. Even though Japan is an NPT signatory, however, high-level officials both prior to and after 3.11 have publicly entertained the notion of Japan's nuclear armament. Former Defence Minister Morimoto Satoshi and LDP Secretary General Ishiba Shigeru have both re-asserted that Japan's commercial nuclear program, plutonium stockpiles and nuclear plant restarts could be regarded as a 'tacit nuclear deterrent' in the eyes of other nations.⁶⁶ Further, in October 2012, Japan's Foreign Ministry refused to sign a UN initiative mounted by 16 member states to outlaw nuclear weapons worldwide as it stated that it would not be compatible with the Japan-US security alliance. In January 2014, Foreign Minister Kishida Fumio, though he stopped short of stating that Japan would endorse the use of nuclear weapons, reiterated that the potential use of nuclear weapons should be limited to extreme circumstances defined by the right to individual and collective self-defence.⁶⁷

Since the late 1950s, there have been elements in the Japanese government (led by Abe's grandfather and former Prime Minister Kishi Nobusuke) who have advocated the procurement of tactical nuclear weapons as an entitlement under the nation's right to self-defence as stipulated in the UN Charter. Although the US has long discouraged Japan's nuclear weaponisation with assurances of extended nuclear deterrence, in 2003 US Vice-President Cheney stated that Japan's possession of nuclear weapons could be tenable if it were aligned to US strategic deterrence policy.⁶⁸ As an NPT signatory, Japan has accumulated the fourth largest stockpile of 'civilian' plutonium, the largest stockpile of any non-nuclear weapons state.⁶⁹ Despite reprocessing programs having been closed down by many other countries, Japan claims

that its significant nuclear reprocessing and fuel fabrication program is for 'energy autonomy' by which it means 'closing the nuclear fuel cycle'. This relies upon the ability to separate plutonium from spent fuel and reprocess and fabricate it 'upwards' so as to produce more plutonium than is consumed, thereby facilitating an endless loop of fuel production and consumption. In this scenario, the Japanese government regards spent nuclear fuel and stockpiled plutonium as an 'asset' rather than a 'debt'.

This ability should not be understood as solely for the reduction of reliance on foreign fuel imports or even of nuclear waste. In 2009, Ernest J. Moniz, an MIT professor and United States Secretary of Energy in 2014, admitted that uranium, once thought to be scarce, was now so abundant as to raise doubt over the necessity for nuclear fuel reprocessing.⁷⁰ As of March 2011, despite the recommendations by the Japan Atomic Energy Commission and the Science Council of Japan of both direct disposal and limited surface storage of spent nuclear fuel in dry casks over fuel pool storage and reprocessing, the Japanese government would not rule out the reprocessing option. If the closed fuel cycle ever did eventuate, it would negate Japan's dependence on the import of vital energy resources (uranium, oil, natural gas) so as to achieve 'energy autonomy'. This would drastically reduce fuel costs and would also reduce vulnerability to sanctions should Japan breach the NPT (or other international agreements) in its decision to 'go nuclear'.

As an interrelated factor, the development of missile technologies by the U.S. military in collaboration with the Japan Self-Defense Force (JSDF) should not be overlooked. In the overall shift in US military posture toward missile and satellite weapons (US Missile Defense (MD) program) since the 1990s, the JSDF has collaborated with the US in joint research into Anti-Ballistic Missile Systems (ABMS), also known as Aegis Ballistic Missile Defense (Aegis

BMD). This System functions as a multi-layered 'fence' of PAC-2 missiles for air defence and SM-3 land and sea missiles (Block II-A) and PAC-3 land missiles for ballistic missile interception either in mid to late flight or even prior to launch from mobile and stationary launch platforms. It is built to be interoperable with US military operations. Infrared spy satellites and advanced radar (X-band) technology form an integral part of the system. Its architecture ties JSDF operations to a larger and broader US 'global missile shield' that includes Aegis-class destroyers, F-35 planes, super-stealth nuclear bombers, and satellite and space weapons.⁷¹

Japan's long-term investment in co-developing this high-level technical capability has made it the second most powerful missile power in the world, and the only nation outside the US with both low and upper-tier defences reputedly capable of intercepting missiles beyond the Earth's atmosphere.⁷² Given this long-term commitment, it was not surprising that the Abe government in 2013 decided to declare the constitutional right to participate in 'collective security' operations with the US and other allies.

Should Japan choose to construct its own nuclear warheads to fit this system, high-grade fissile material from its own nuclear reprocessing facility would be necessary. Alternatively, pre-loaded missiles could be 'shared' with the US, or US extended nuclear deterrence could be continued. In any case, it would mean Japan becoming a 'proxy nuclear weapons state' in contravention of its NPT obligations (Article II). It would also implicate those of Japan's bilateral nuclear suppliers with whom it has Agreements based on IAEA safeguards. The full-scale production and export of this system to Aegis-capable nations (which at this point are South Korea, Australia, Norway and Spain) together with upgrades planned from 2018 (such as 'Aegis ashore') would further degrade the NPT regime.⁷³

This technology, and Japan's ambiguous intentions concerning nuclear and space weaponisation, means that the US and Japan, in collaboration with partners such as Australia and India (in sea-going operations in particular), could potentially integrate not only their BMD systems but also their nuclearized capabilities. As South Korea and Taiwan have also expressed interest in reprocessing their spent nuclear fuel (as have other states such as Saudi Arabia), these developments carry strong potential for proliferation.

One of the major implications of this distributed form of 'self-defence' is that US Pacific Command would further extend the preemptive strike capacity of its global nuclear strike force. With Japan's recent release of space assets for military use (reconnaissance, communications, navigation, early warning) in collaboration with the US, this further augments the current period of US 'nuclear primacy' and a return to the conditions prior to 1963 when the Soviets had developed long-range bombers to deliver their nuclear payloads over US territory. Nuclear primacy transcends the concept of Mutually Assured Destruction in its ability to win a nuclear war, which the US is proposing to do by eliminating retaliatory capability with a single massive attack called 'Prompt Global Strike'.

The Obama administration has claimed to have reduced the number and tonnage of nuclear weapons held in US stockpiles in accordance with the New START treaty signed with Russia in 2010. Yet its current plan estimated at roughly US \$355 billion in the first ten years has focused on deploying smaller yet more powerful and lethal nuclear weapons. Throughout this process, the Obama administration has maintained the US policy of nuclear first strike against nuclear weapons states and the right to use nuclear weapons in extreme circumstances to 'defend the vital interests of the United States or its allies and partners'.⁷⁴ In addition, the US also released a

thirty-year 'modernization' plan for the US nuclear arsenal estimated to amount to US \$1 trillion which will see a renewal of existing nuclear warheads, development and construction of improved nuclear weapon delivery systems (submarines, bombers, missiles), and upgrade of major nuclear weapons plants and laboratories. Aside from undermining the New START initiative, this could be used to force compliance and further undermine international stability.⁷⁵

Conclusion

Under the Australia-India uranium trade agreement, India will use Australian yellow cake to diversify its nuclear program. If and when the Japan-India Nuclear Cooperation Agreement is concluded, it will supply the nuclear technology India requires to build its industrial capacity and indirectly enhance its nuclear arsenal. Negotiated almost simultaneously and in coordination, both of these Agreements, together with and following the US-India nuclear agreement, tacitly legitimise India's nuclear status and assist in its ambitions for greater international influence. Australia and Japan, both NPT and NSG members, have become complicit in India's nuclear weapons program and partially responsible for increasing the risk of nuclear accident in India, and for potentially aggravating nuclear rivalry in Asia.

India claims to need more electricity for domestic and industrial growth as well as to lift a significant population out of poverty. Yet there are many factors which create the conditions for the advance of India's poor, just as there are many forms of alternative energy generation beyond nuclear and coal which would be safer, more reliable and powerful if given comparable investment and with smart power grid distribution networks.⁷⁶ To the extent that governments and corporations continue to invest in nuclear power construction and reprocessing as a source of

‘renewable energy’, they diminish the potential to stem the destructive and exponentially increasing effects of climate change.⁷⁷ China, Germany, the United States, India and even Japan are presently leading the world in investing in renewable energy technology. Yet, with the exception of Germany, this is being done in parallel with plans to expand nuclear power production.

The ongoing contamination from radiation dispersed from the Fukushima Daiichi nuclear power plant came, in part, from Australian uranium.⁷⁸ When the benefits of uranium trade are weighed against the potential and actual costs and damages from uranium mining, the actual risks of nuclear reactor accidents and mismanagement, the decline in costs and advances in renewable technologies, potential nuclear weapons use (broadly defined) and proliferation, and the steady production of nuclear waste, it becomes clear that state-corporate policies to expand the industry are ill-conceived.

In 2014, as in 1945 and throughout the intervening decades, uranium mining, nuclear power generation and nuclear weapons remain ineluctably tied to the formation of a global power structure of nation-states and transnational corporations and instrumental in their overarching ambitions.

⁴⁴ Comprising six open-cut pits and five underground mines, the Carmichael mine will cover an area seven times that of Sydney Harbour. Despite warnings from the [Great Barrier Reef Marine Park Authority](#) and UNESCO that this will place it 'in danger', plans to dredge and dump about 3 million cubic metres of the Reef into a wetlands sanctuary to make way for port expansions for 480 additional ships to access 330 million tonnes of coal per year from this mega-mine will use 12 billion litres of fresh water per year and will affect the habitat of humpback whales, sea turtles and dugongs. With 130 million tonnes of carbon dioxide produced every year for ninety years, this will cancel out the Queensland Direct Action target of 131 million tonnes of carbon dioxide reduction. Adani Enterprises has a dubious track record including illegal large-scale exports of iron ore at its port and numerous cases of environmental pollution. It has also been a significant supporter of the Bharatiya Janta Party. Deutsche Bank, HSBC, Citi, Morgan Stanley and possible JP Morgan Chase and Goldman Sachs have refused to fund the project while the 'big four' Australian banks seem to be giving their approval. India is the third largest producer, consumer and importer of coal in the world and the fourth largest energy consumer in the world. See, Mary McCarthy, 'Darwin and Adelaide likely export hubs for Queensland uranium', *ABC Rural*; Ben Pearson, 'Carmichael coal mine impacts will be felt for generations,' *ABC Environment*, 28Jul2014, William Rollo, '[Carmichael Coal and Rail Project: Queensland mine gets Federal Government approval](#)', *ABC News*, 29 July 2014; Candace Dunn, '[India falls back on imported fossil fuels](#)', *Business Spectator*, 15 August 2014.

September - August 2012.

⁴⁶ In support of the claim for the rapid shift from fossil fuels to renewable energy and energy savings, the United Nations' Secretary General Ban Ki-moon stated 'We need to limit global temperature rise within 2 degrees Celsius above pre-industrial levels. This is what the international community has recognised as the upper limit of safety. Beyond 2 degrees, the consequences will be unpredictable, highly dangerous and perhaps irreversible'. See, United Nations, '[Secretary-General's remarks at Climate Leaders Summit](#)', 11 April 2014. It is estimated that at least two thirds of proven fossil fuel reserves must stay in the ground and that carbon utilities and infrastructure must be developed beyond 2017 as 80 percent of cumulative emissions allowable between 2010 and 2035 are already locked into existing power plants, factories, buildings and services. In addition this will result in significant positive in health effects, job production, biodiversity conservation, energy independence and stronger sovereignty and resilience. Although several countries have moved to end public finance for coal and other fossil fuels, Australia has yet to do so in a significant manner. See [WHO - 7 million premature deaths linked to air pollution](#) and [Climate Change - IPCC Response Strategies](#).
